Controlling a sea of data with the introduction of data classification

Industry:
Oil & Gas

Product:
Fortra's Titus Classification Suite

Solution:
Data Classification

THE CHALLENGE

A Chinese offshore oil corporation required a data classification solution to ensure they were meeting specific security standard requirements set by external auditors. With no classification or data tagging solution in place, they needed a solution that could flag to users whether a file or email should be treated as Internal, External or Confidential with clear visual tags.

THE SOLUTION

With HANDD's assistance and market-leading knowledge, Fortra's Titus was selected as the approved classification solution that would best serve the business. Its easy-to-use administration console would make it easier to roll-out effective policies to its 2,500 employees globally, whilst its ability to retrospectively identify and then blanket classify data at rest would also ensure the client could mitigate any previous, current and future data handling risks for the business.

THE BENEFITS

With Fortra's Titus, our client can now have confidence that auditors will be satisfied that security standards are being met by all users. A centralised, easy-to-use and intuitive administration console enables our customer to tailor classification policies to the needs of differing user groups. Meanwhile, training received by employees extends beyond system use to improve ongoing individual security awareness.
